AQBot™ Usecases

Industrial Process Control

Ambient air pollution parameters like particulate matter, gases, and noise are often caused by various processes in the industries. Measuring these parameters using AQBot™ not only ensures continuous monitoring but also provides automating the operation of pollution control equipment to meet regulatory standards.

Leakage Detection

Leakages in the industry can cause unfortunate accidents and cause a potential risk to the health of the workers. Continuous monitoring of ambient air in industrial premises ensures in-time anomaly detection like gas leakages, a sudden rise of PM, noise levels or harmful gases. Alerts & alarms generated can assist in immediate actions.

Indoor Air Quality Monitoring

AQBot™ is an ideal choice to continuously monitor specific air quality parameters in an enclosed industrial facility. Often it is important to monitor these parameters to ensure a safe environment. The data is used for various applications like compliance, safety, reporting, data logging, automation, etc.

EHS monitoring

By continuous monitoring of critical air quality parameters like VOC, H₂S, NH₃, etc. in an industrial work environment, precautionary steps can be taken for the health and safety of workers to comply with regulatory acts like OSHA. Additionally, EHS managers can continuously track and mitigate any potential hazards.

Data Visualization Software

An on-device data software enables users to access the data, configure networks and sensors without any dependency on the internet. Users can also connect their smart devices to the AQBot™ and view real-time data, perform on-site calibration, change network configuration (i.e. GSM/Wifi/Ethernet/MODBUS), and change sensor configuration (enable/disable any sensor data).

Data and Calibration

1 FACTORY CALIBRATION

Factory calibration is performed by the sensor manufacturing partners. All individual sensors are kept under lab conditions and calibrated with zero air and with calibration gas. This process ensures that all the sensors are functioning as per the requirement.

2 LABORATORY CALIBRATION

In laboratory calibration, assembled AQBot™ devices are calibrated with pure air and NIST traceable calibration gases. In a clean and controlled laboratory setting, zero and span calibration is performed in order to determine the sensor offset or gain error if any. The PM sensors are collocated against a reference system- Met One BAM 1020. Every AQBot™ is dispatched with a calibration certificate generated by a NABL/ISO IEC 17025 accredited laboratory.

3 ON-SITE CALIBRATION

Using a zero air cylinder or a generator, users can now calibrate the AQBot™ at their premises without the need to de-install the unit. The calibration module in the on-device data visualization software allows the user to apply drift to any change in the sensor readings.
